

Hello everyone, I'm the new guy, both here in the forum and generally at eBlocker!

When I was looking for some protection against data octopuses, websites full of advertising and other dangers on the Internet, I came across eBlocker, among others. I also looked at AdGuard

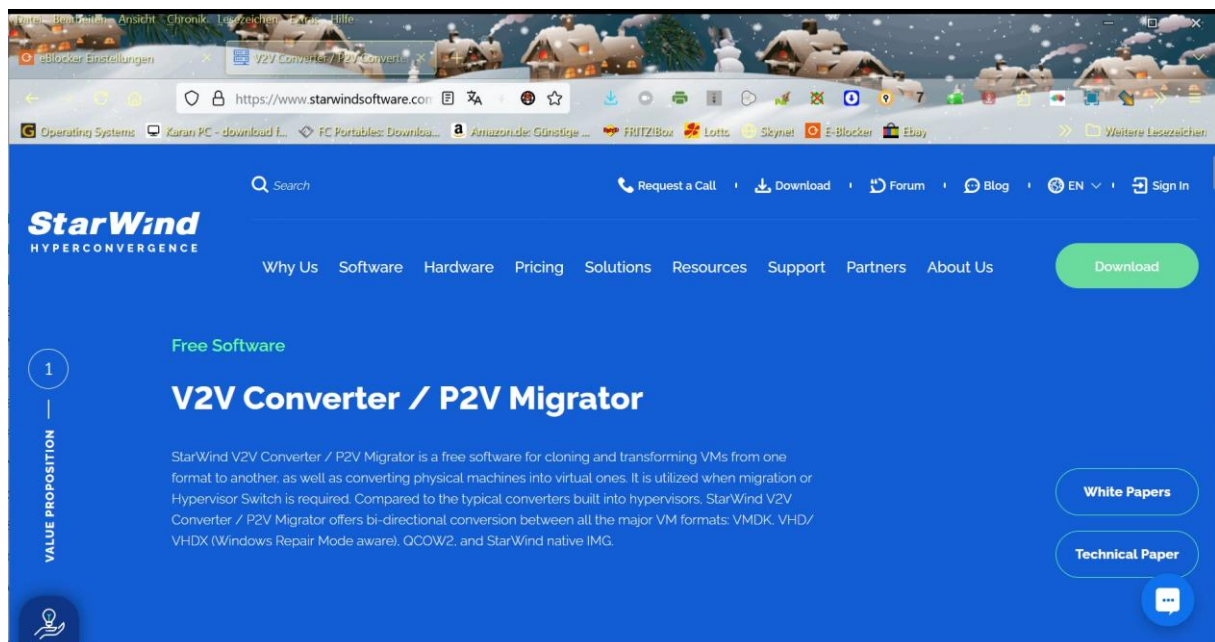

and PiHole, but eBlocker ultimately convinced me for various reasons! Above all, the (relatively) easy handling, the protection can be switched on and off separately for each device (PC, TV, tablet...), I don't have to change too many settings in my FritzBox and especially on my devices and everything still works wonderfully!

What struck me as negative here at eBlocker was the fact that the VM editions are treated very poorly, they are outdated and buggy!

That's why I decided to create my own bug-free version and that finally worked! In this tutorial I want to show you how I did it and how you can always create an up-to-date image for your preferred VM version in the future, using VMware Workstation 16 as an example. I realize that VMware is already available in version 17+, but unfortunately VMware also has some bugs in newer versions, including defective audio output in older Windows VMs (XP and lower I think). Although it's probably not that relevant for this purpose, I'm sticking with version 16 anyway. You can of course use a current version too... One more small note, the finished image is significantly larger (almost 10GB) than the ones offered here in the forum (almost 3GB if I see it correctly), but I think that's probably secondary these days.

Hallo zusammen, ich bin der Neue, sowohl hier im Forum, als auch generell bei eBlocker! By the way, this tutorial was created with the kind support of Google Translate, in case it contains spelling mistakes...

Ok, enough of the preamble, now let's get started!

First, go to the following Website

<https://de.starwindsoftware.com/starwind-v2v-converter>

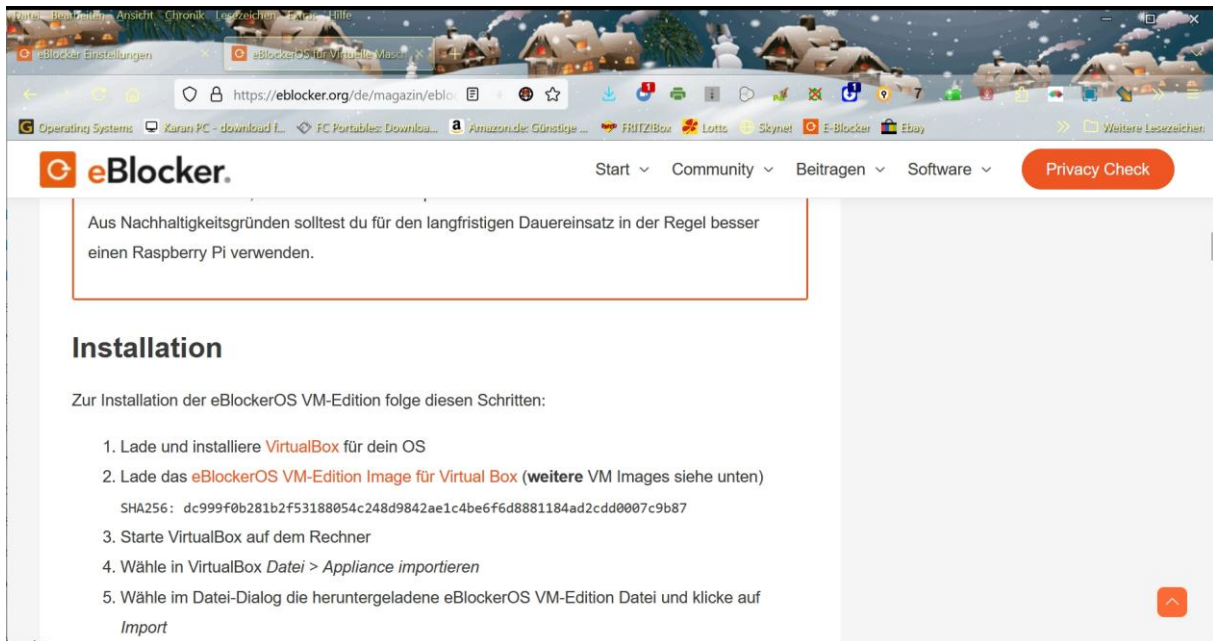

and download the starwind-v2v-converter from there. You do have to register with the manufacturer to do this, but the program itself is free!

I myself downloaded a portable version of the program from a "dubious" website,

but firstly, it's not entirely legal and secondly, it carries the risk of catching viruses, Trojans and other vermin, which is why I STRONGLY recommend using the OFFICIAL VERSION from the manufacturer!!!

I used the unofficial version because I generally don't like installing programs that often make autostart and registry entries!

This tutorial is aimed at the portable version, but should be almost identical to the installed version.

Then go to the eBlocker website and download the OFFICIAL VM image in .omv format. It's best to save everything in a single folder like in the example!

Name	Änderungsdatum	Typ	Größe
 StarWind V2V Image Converter.zip	22.01.2025 19:13	ZIP-Datei	

Then unpack e.g. with 7zip (portable) or install the starwind-v2v-converter.

Name	Änderungsdatum	Typ	Größe
 StarWind V2V Image Converter.exe	06.05.2018 16:42	Anwendung	
 StarWind V2V Image Converter.zip	22.01.2025 19:13	ZIP-Datei	

You can also unpack the .omv image with 7zip, preferably into a separate folder!

Name	Änderungsdatum	Typ	Größe
 eBlockerVM-3.0.3-amd64.ova	26.01.2025 14:19	Open Virtualization F...	1.
 StarWind V2V Image Converter.exe	06.05.2018 16:42	Anwendung	

There should then be 3 files in the folder as shown.

Name	Änderungsdatum	Typ	Größe
eBlockerVM-3.0.3-amd64	26.01.2025 14:22	Dateiordner	
eBlockerVM-3.0.3-amd64.ova	26.01.2025 14:19	Open Virtualization F...	1.
StarWind V2V Image Converter.exe	06.05.2018 16:42	Anwendung	

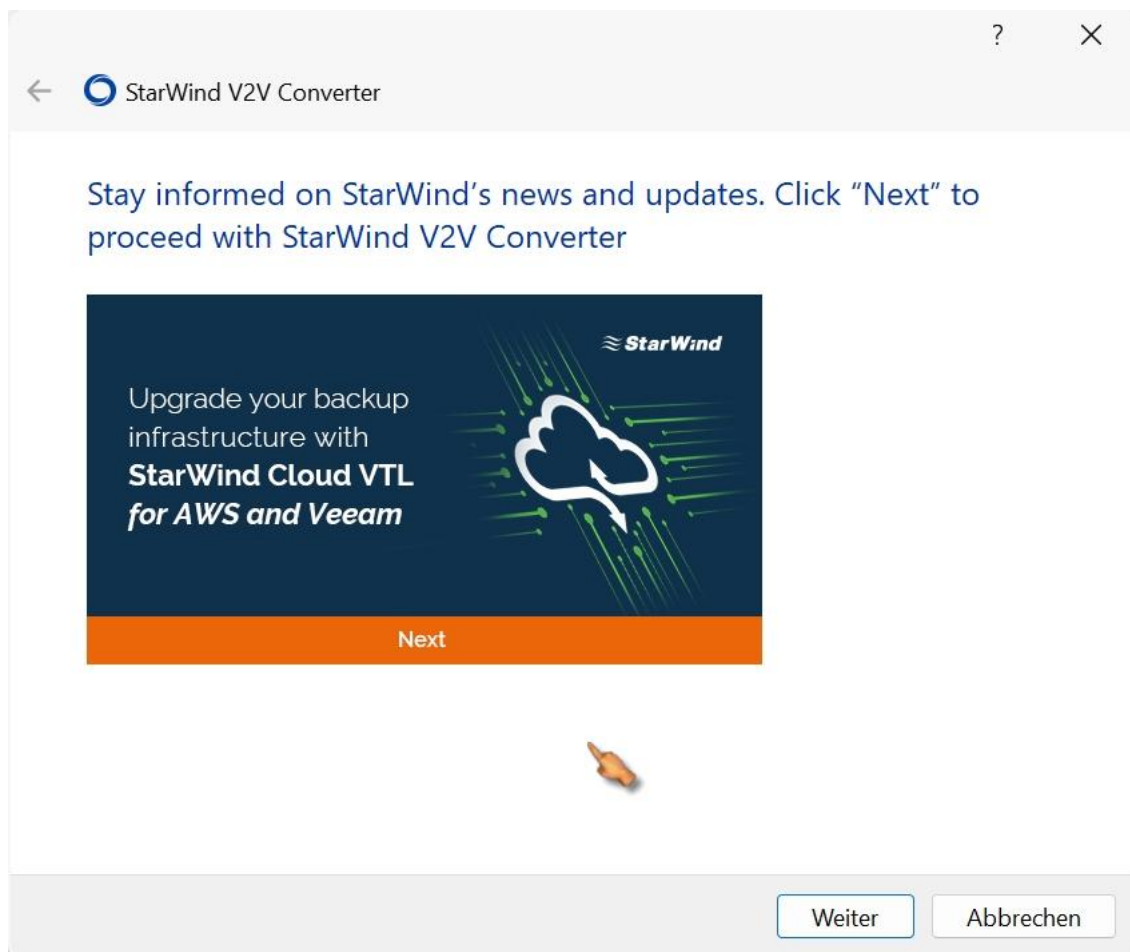

Then you create a subfolder in your work folder, in my example I named this eBlocker converted.

Name	Änderungsdatum	Typ	Größe
eBlockerVM-3.0.3-amd64	26.01.2025 14:22	Dateiordner	
eBlocker Konvertiert	26.01.2025 14:26	Dateiordner	
eBlockerVM-3.0.3-amd64.ova	26.01.2025 14:19	Open Virtualization F...	1.
StarWind V2V Image Converter.exe	06.05.2018 16:42	Anwendung	

When you open the portable version of starwind-v2v-converter (preferably as administrator) for the first time, your anti-virus program may complain. If you are sure that you can trust the source of the program (this may also happen if you start the official program), you must create a share. In the portable version, the program creates a folder called Data.

Name	Änderungsdatum	Typ	Größe
eBlocker Konvertiert	26.01.2025 14:26	Dateiordner	
eBlockerVM-3.0.3-amd64	26.01.2025 14:22	Dateiordner	
eBlockerVM-3.0.3-amd64.ova	26.01.2025 14:19	Open Virtualization F...	1.
StarWind V2V Image Converter.exe	06.05.2018 16:42	Anwendung	
Data	26.01.2025 13:17	Dateiordner	

On the welcome window, click on next, then when the selection is on local file, click on next again, then under Source Image in the folder in which you previously unpacked the .omv image, select the file eBlockerVM-disk001.vmdk and click on next

### Source image location

Source image location:

- Local file
- VMware ESXi Server
- Microsoft Hyper-V Server

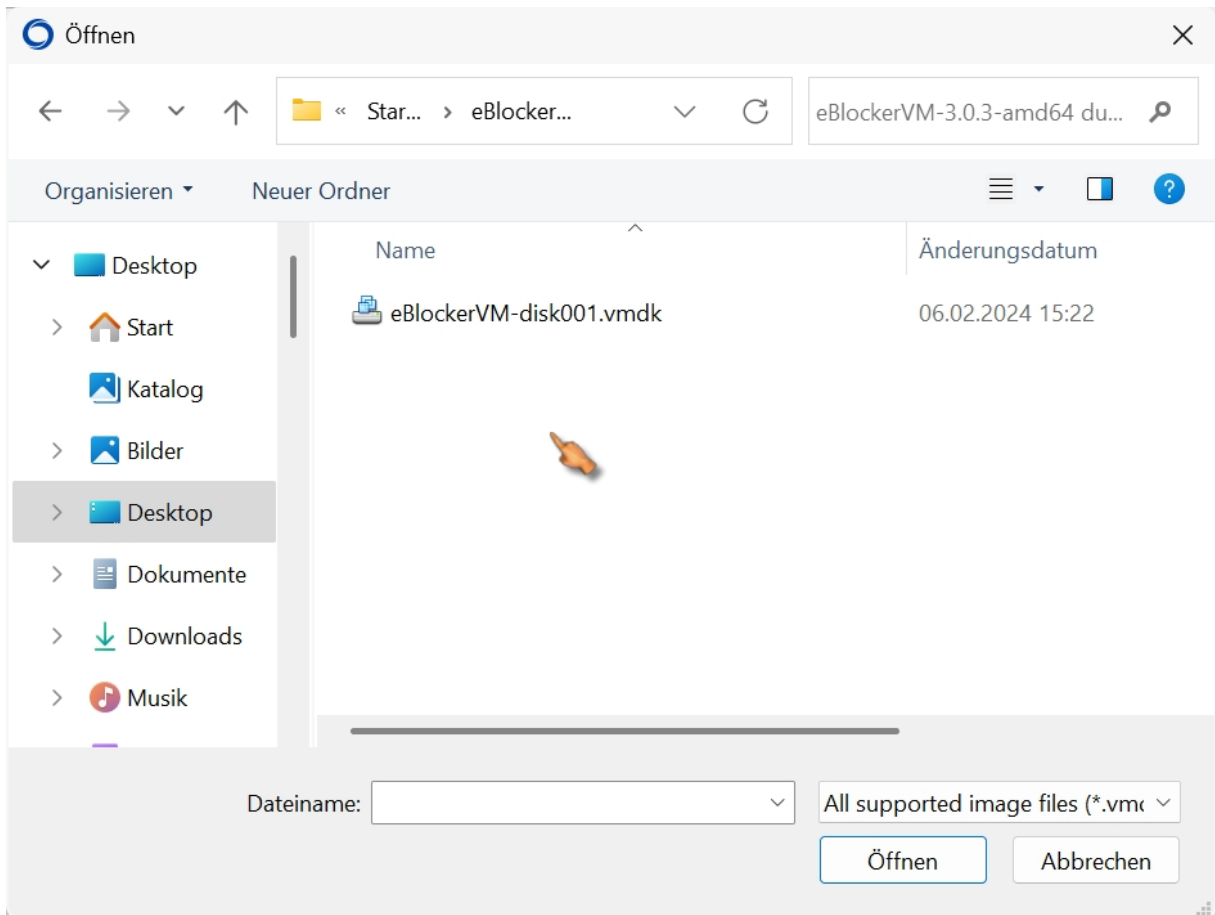

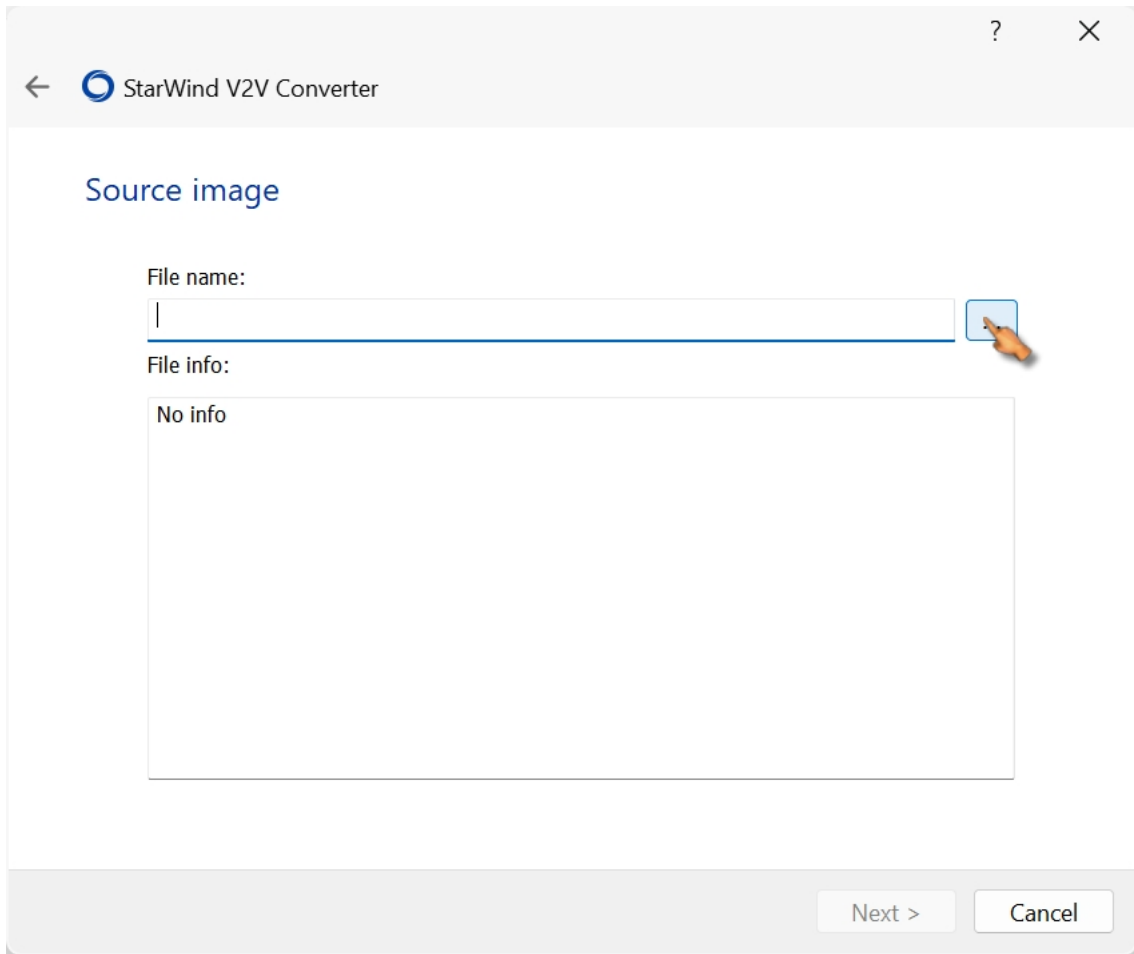

Location description:

File on the local machine.

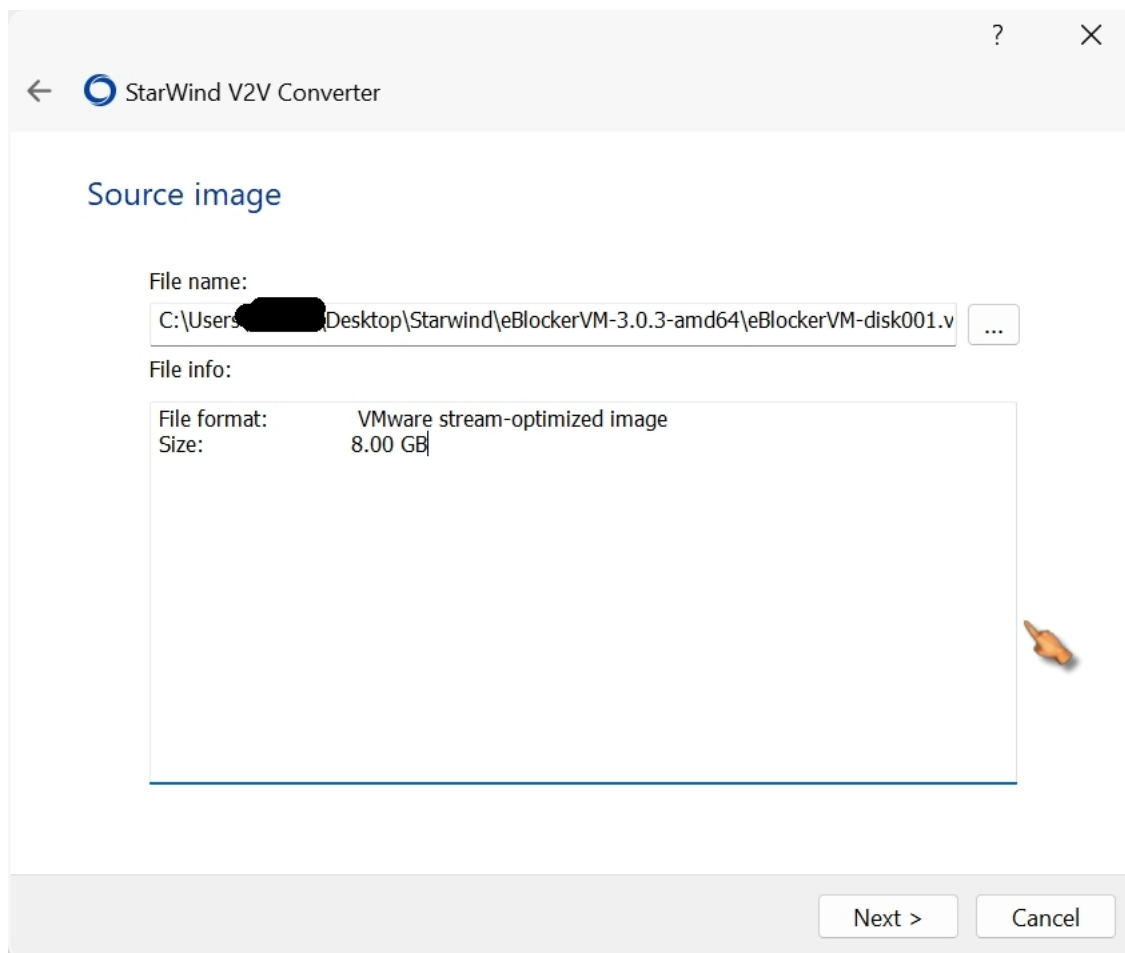

Next >

Cancel

and comes to the Destination Image Format window, there you can choose the one for your preferred VM, in my case I chose the third option, VMware pre-allocated

Image!

## Destination image format

### Image format:

- VMware growable image
- VMware stream-optimized image
- VMware pre-allocated image
- VMware ESX server image
- VMware direct conversion to ESXi
- Microsoft VHD growable image
- Microsoft VHD pre-allocated image
- Microsoft VHDX image
- QCOW2 disk image
- Raw image

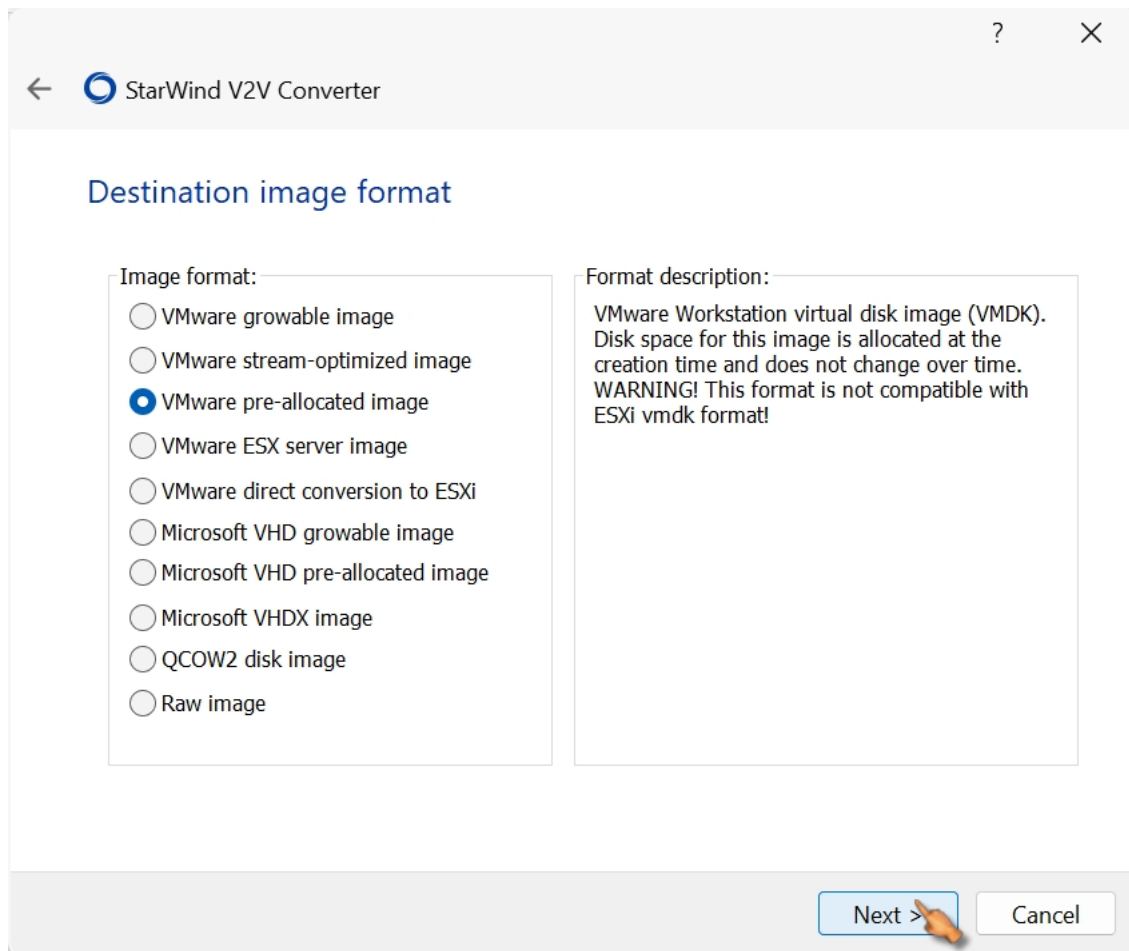

### Format description:

VMware Workstation virtual disk image (VMDK). Disk space for this image is allocated on demand, so disk size of this image grows over time. **WARNING!** This format is not compatible with ESXi vmdk format!

Next >

Cancel

I simply confirmed the next window and in the following window selected the folder in which the converted image should be saved. Remember, we called the folder eBlocker converted!

### VMDK Options

Virtual disk type

IDE

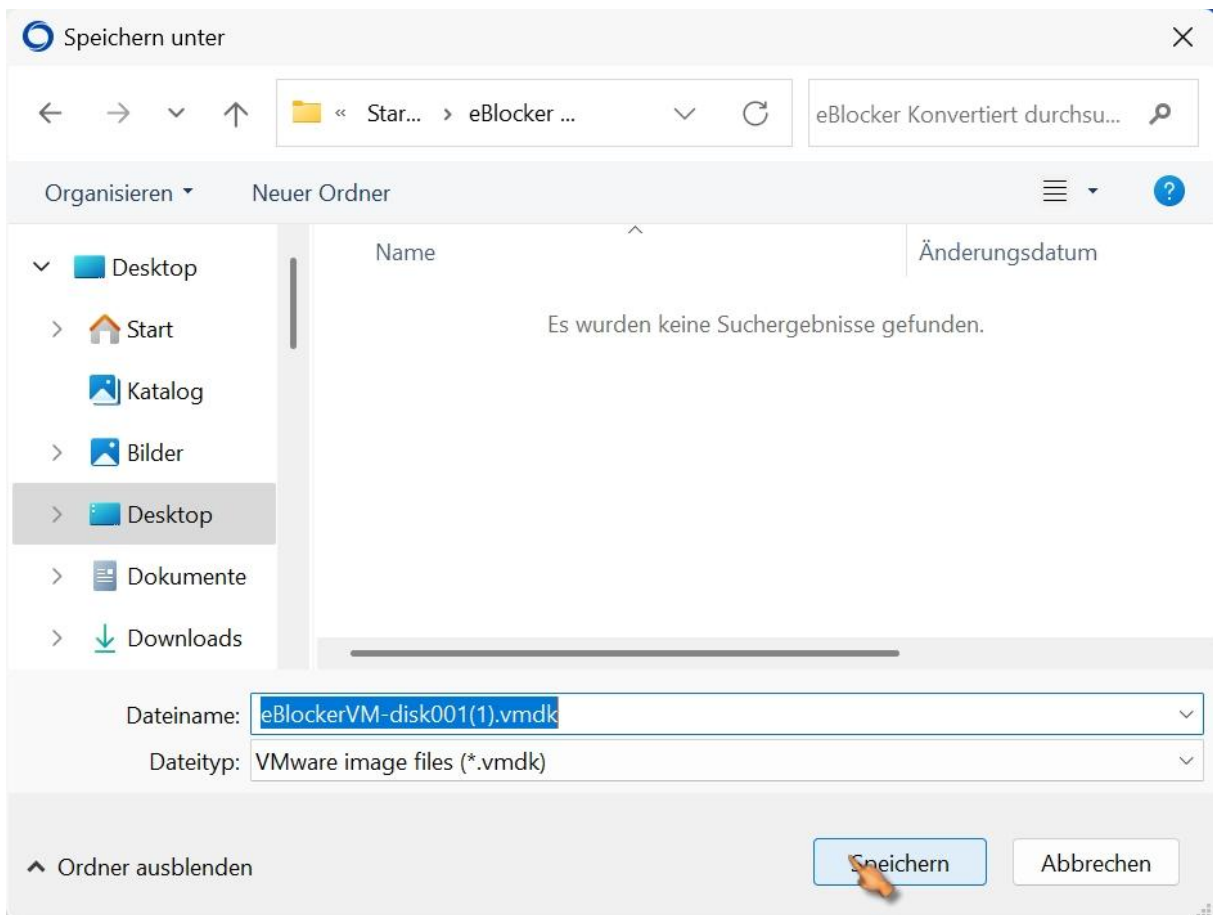

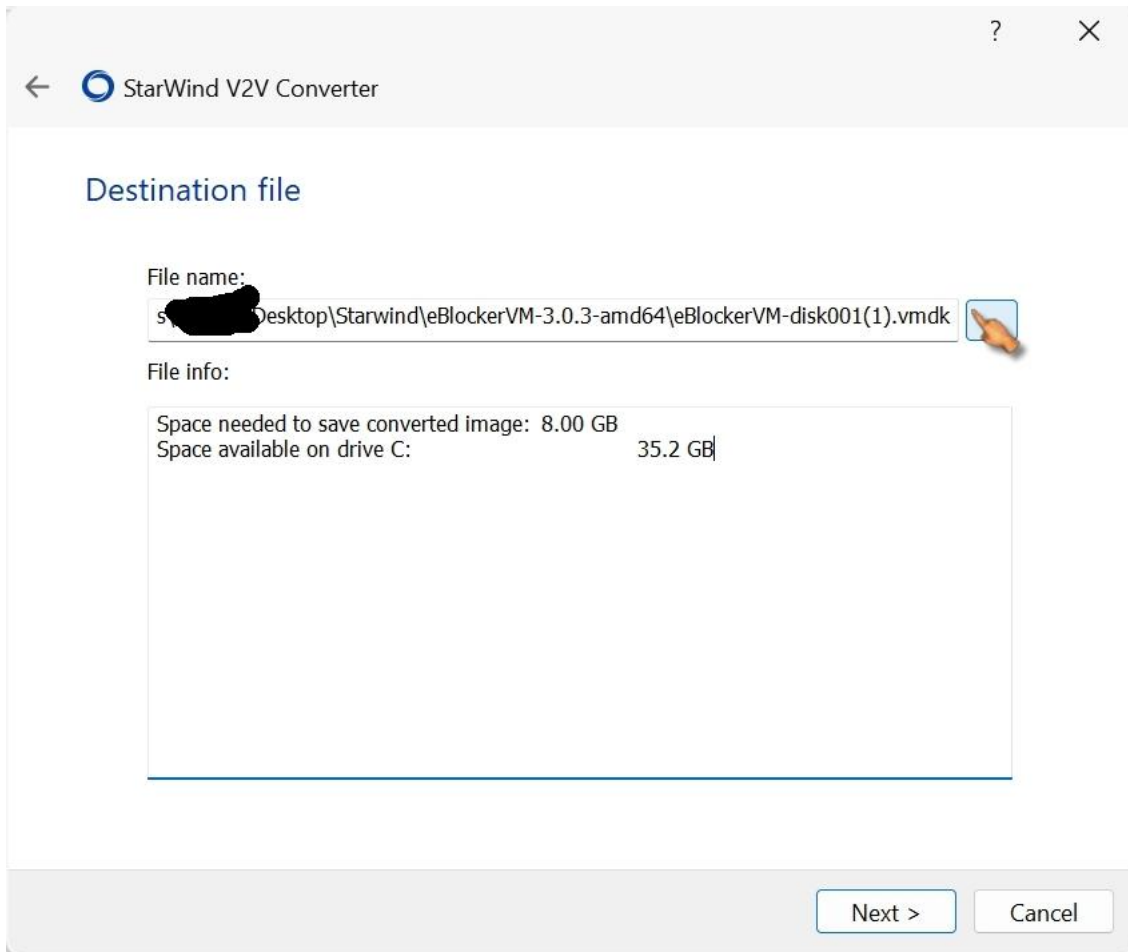

SCSI

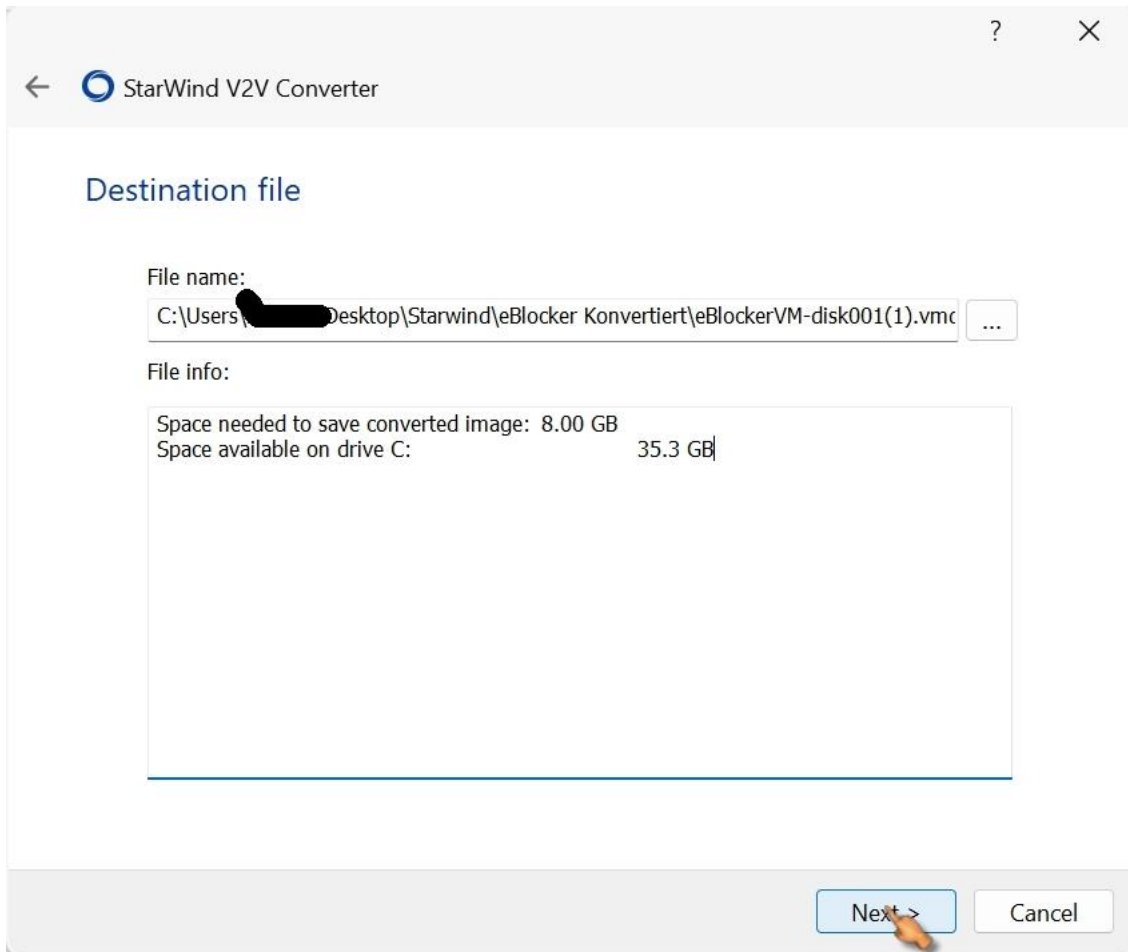

Additional options

Activate Windows Repair Mode

Next >

Cancel

If you confirm this time, the conversion will begin and at the end it should look something like this

## Converting

30 %

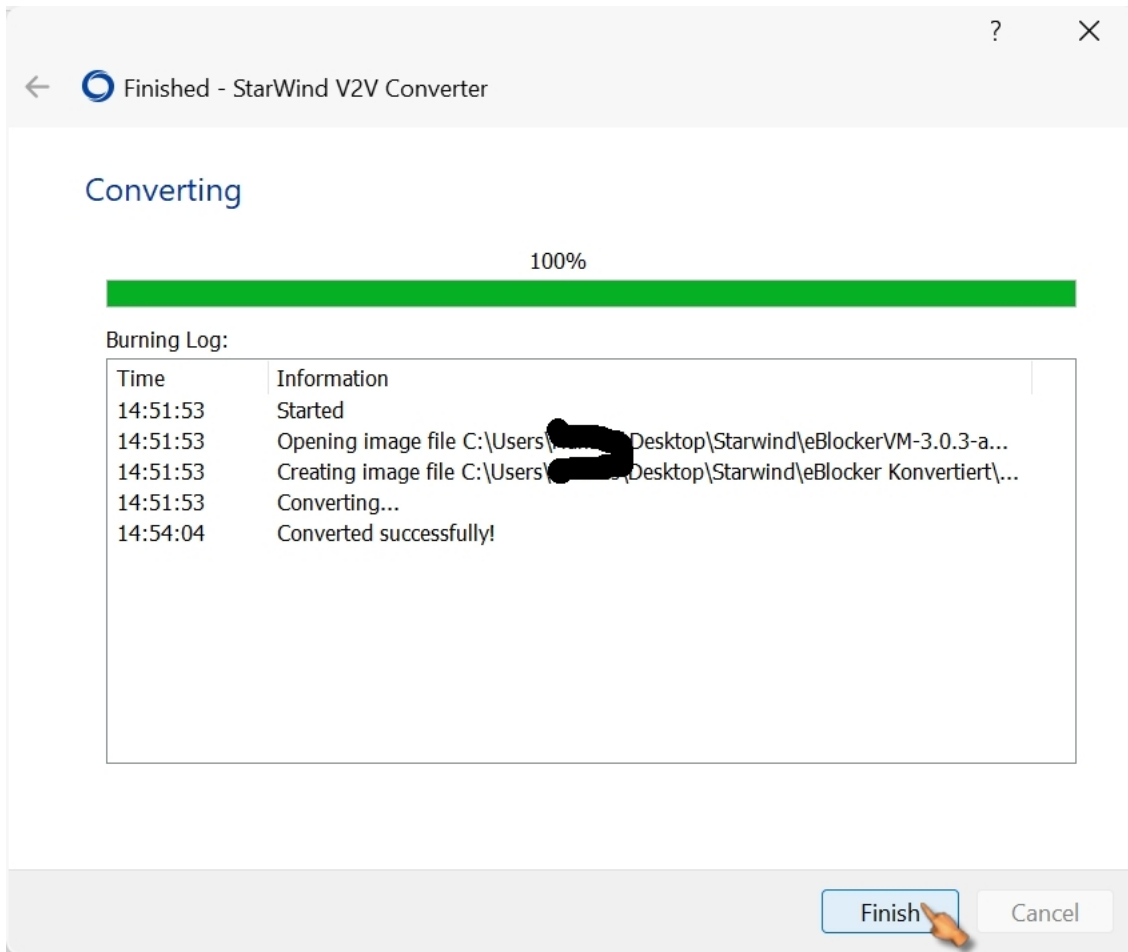

### Burning Log:

Time	Information
14:51:53	Started
14:51:53	Opening image file C:\Users\...\Desktop\Starwind\eBlockerVM-3.0.3-a...
14:51:53	Creating image file C:\Users\...\Desktop\Starwind\eBlocker Konvertiert\...
14:51:53	Converting...

Finish

Cancel

The following files should then be found in the eBlocker converted folder.

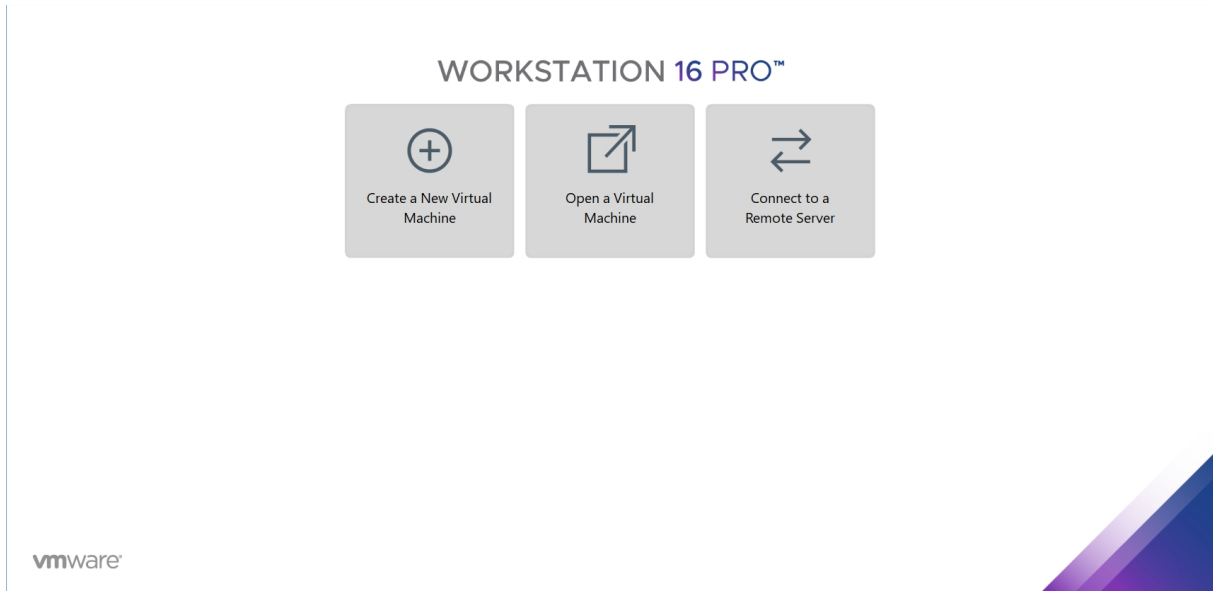

Copy or move the eBlocker converted folder to your VMware folder

(My Virtual Machines) and rename eBlocker converted to e.g.

eBlocker 3.1 or whatever...

Name	Änderungsdatum	Typ	Grö
 eBlockerVM-disk001(1).vmdk	26.01.2025 14:51	VMware virtual disk file	
 eBlockerVM-disk001(1)-flat.vmdk	26.01.2025 14:54	VMware virtual disk file	8.

Then start VMware Workstation and click on Create a new Virtual Machine

In the following window select custom (advanced), continue,

### Choose the Virtual Machine Hardware Compatibility

Which hardware features are needed for this virtual machine?

Virtual machine hardware compatibility

Hardware compatibility: Workstation 16.x

Compatible with:  ESX Server

Compatible products:

- Fusion 12.x
- Workstation 16.x

Limitations:

- 128 GB memory
- 32 processors
- 10 network adapters
- 8 TB disk size
- 8 GB shared graphics memory

Chose the Virtual machine Hardware Compatibility (I left it like that), continue

### Guest Operating System Installation

A virtual machine is like a physical computer; it needs an operating system. How will you install the guest operating system?

Install from:

Installer disc:

No drives available

Installer disc image file (iso):

G:\VMware\Backup Zubehör\tiny10 x64 23h2\tiny10 x6

Browse...

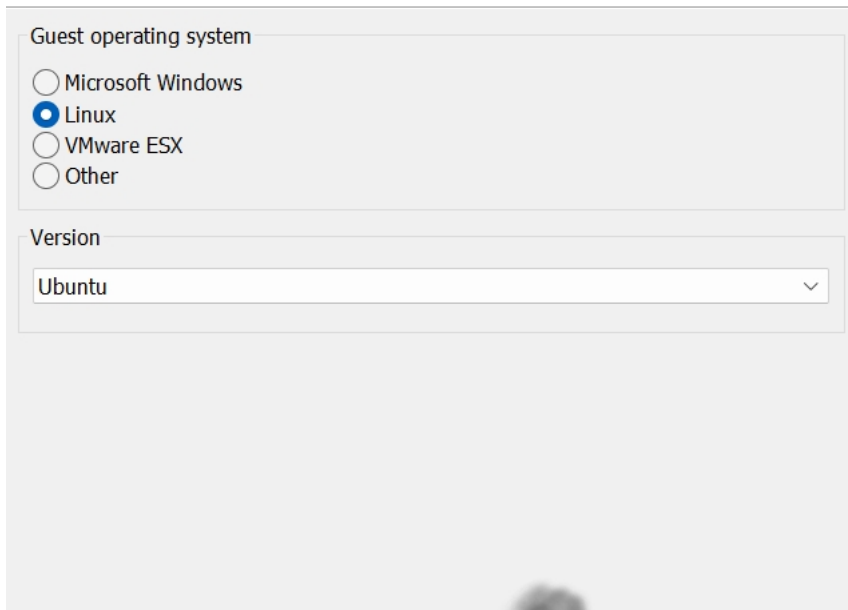

I will install the operating system later.

The virtual machine will be created with a blank hard disk.

there you select i will install the operating system later, next

### Select a Guest Operating System

Which operating system will be installed on this virtual machine?

Guest operating system

Microsoft Windows

Linux

VMware ESX

Other

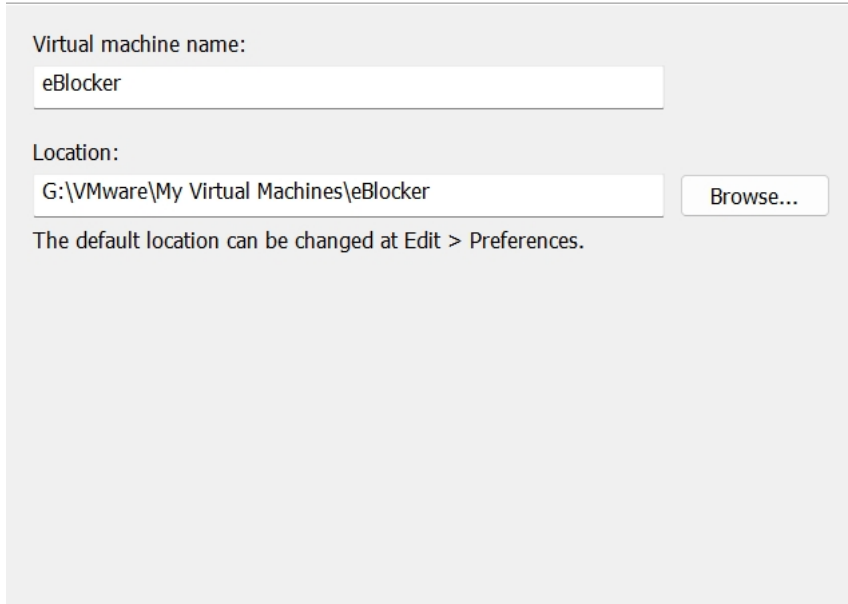

Version

Ubuntu

I chose Linux, which one I think doesn't really matter, the most suitable would probably be Debian, but since I wasn't sure which kernel or 32 or 64 bit I left it on Ubuntu..., more

### Name the Virtual Machine

What name would you like to use for this virtual machine?

Virtual machine name:

eBlocker

Location:

G:\VMware\My Virtual Machines\eBlocker

Browse...

The default location can be changed at Edit > Preferences.

Here you can change the name of your VM, it doesn't matter what you want to call it!, continue

### Processor Configuration

Specify the number of processors for this virtual machine.

Processors

Number of processors:	<input type="text" value="1"/>
Number of cores per processor:	<input type="text" value="2"/>
Total processor cores:	2

In this window you should select the processor configuration, no idea why in the standard configuration 2 processors, 1 core is selected, if you leave it like that, I haven't noticed any difference so far, for most private PCs the correct option would be 1 processor, 2 cores as shown! Maybe it's because many professional servers actually have several processors with several cores installed and therefore 2 processors are preselected..., more

### Memory for the Virtual Machine

How much memory would you like to use for this virtual machine?

Specify the amount of memory allocated to this virtual machine. The memory size must be a multiple of 4 MB.

Memory for this virtual machine:  MB

128 GB -  
64 GB -  
32 GB -  
16 GB -  
8 GB -  
4 GB -  
2 GB -  
1 GB -  
512 MB -  
256 MB -  
128 MB -  
64 MB -  
32 MB -  
16 MB -  
8 MB -  
4 MB -

■ Maximum recommended memory: 13.2 GB  
■ Recommended memory: 4 GB  
■ Guest OS recommended minimum: 2 GB

The storage is preselected at 4096GB, I halved that to 2048MB and haven't noticed any

negative side effects so far!, continue

### Network Type

What type of network do you want to add?

Network connection

- Use bridged networking  
Give the guest operating system direct access to an external Ethernet network. The guest must have its own IP address on the external network.
- Use network address translation (NAT)  
Give the guest operating system access to the host computer's dial-up or external Ethernet network connection using the host's IP address.
- Use host-only networking  
Connect the guest operating system to a private virtual network on the host computer.
- Do not use a network connection

I chose bridged for the network type, and I also gave this VM a FIXED IP address in my Fritzbox, e.g. 192.168.178.78, you have to adapt this to your

specific network settings and release TCP port 3000 and UDP port 1194!!! Continue

### Select I/O Controller Types

Which SCSI controller type would you like to use for SCSI virtual disks?

I/O controller types

SCSI Controller:

- BusLogic (Maximum disk capacity: 2 TB)
- LSI Logic (Recommended)
- LSI Logic SAS
- Paravirtualized SCSI

Just confirm this window and the following one, continue

### Select a Disk Type

What kind of disk do you want to create?

Virtual disk type

- IDE
- SCSI (Recommended)
- SATA
- NVMe

In the Select a Disk window, select use an existing virtual disk, continue

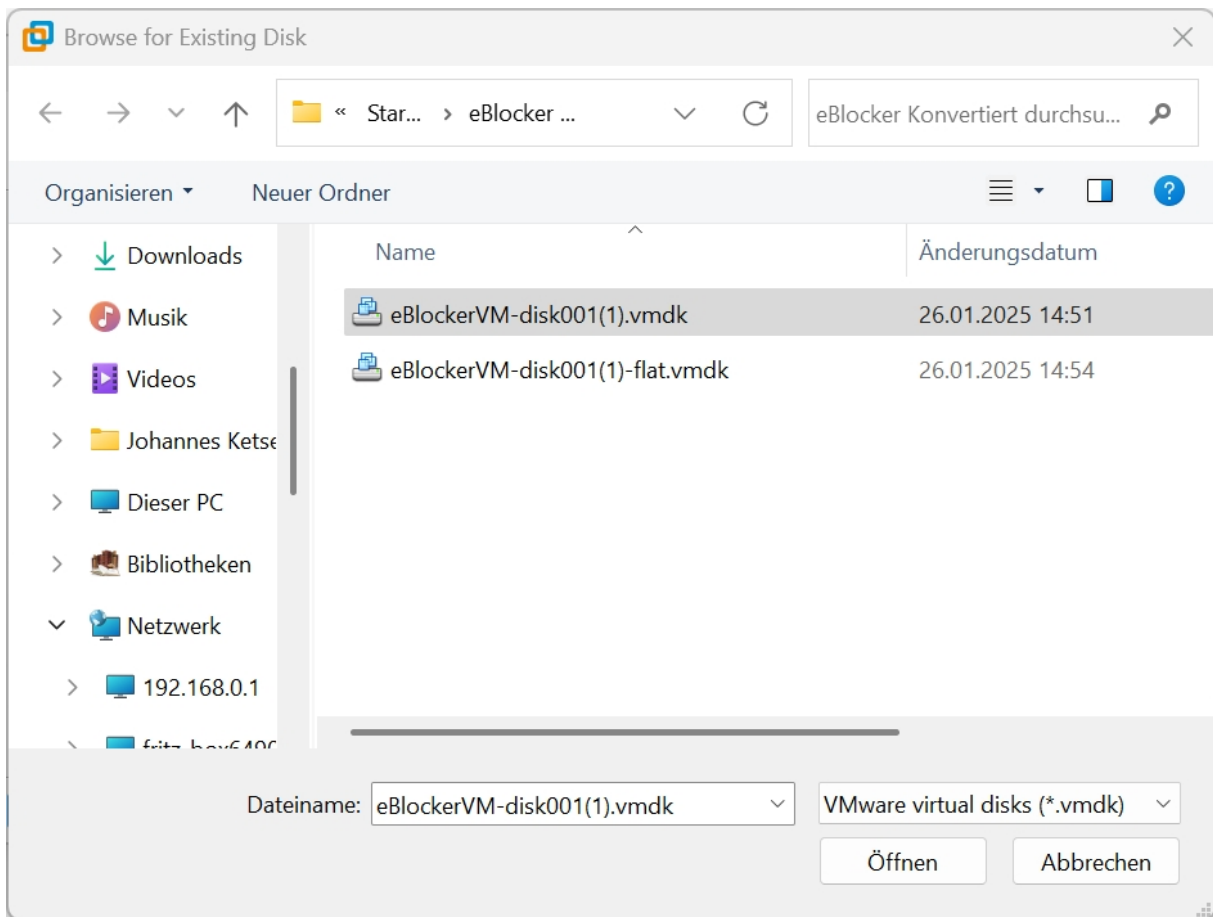

### Select a Disk

Which disk do you want to use?

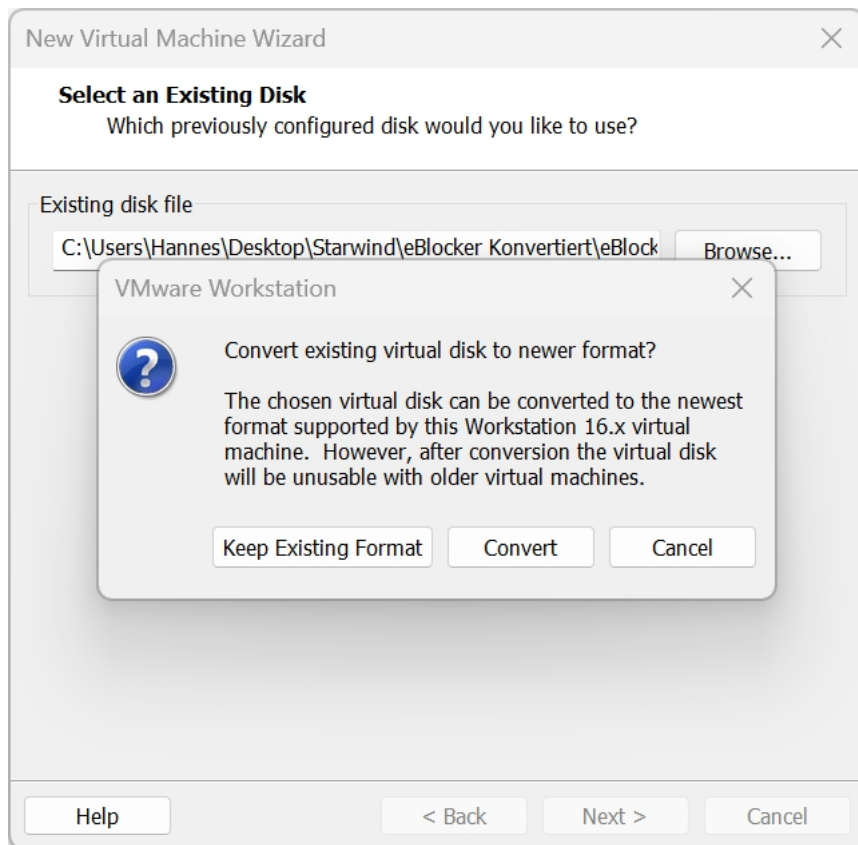

Disk

- Create a new virtual disk  
A virtual disk is composed of one or more files on the host file system, which will appear as a single hard disk to the guest operating system. Virtual disks can easily be copied or moved on the same host or between hosts.
- Use an existing virtual disk  
Choose this option to reuse a previously configured disk.
- Use a physical disk (for advanced users)  
Choose this option to give the virtual machine direct access to a local hard disk. Requires administrator privileges.

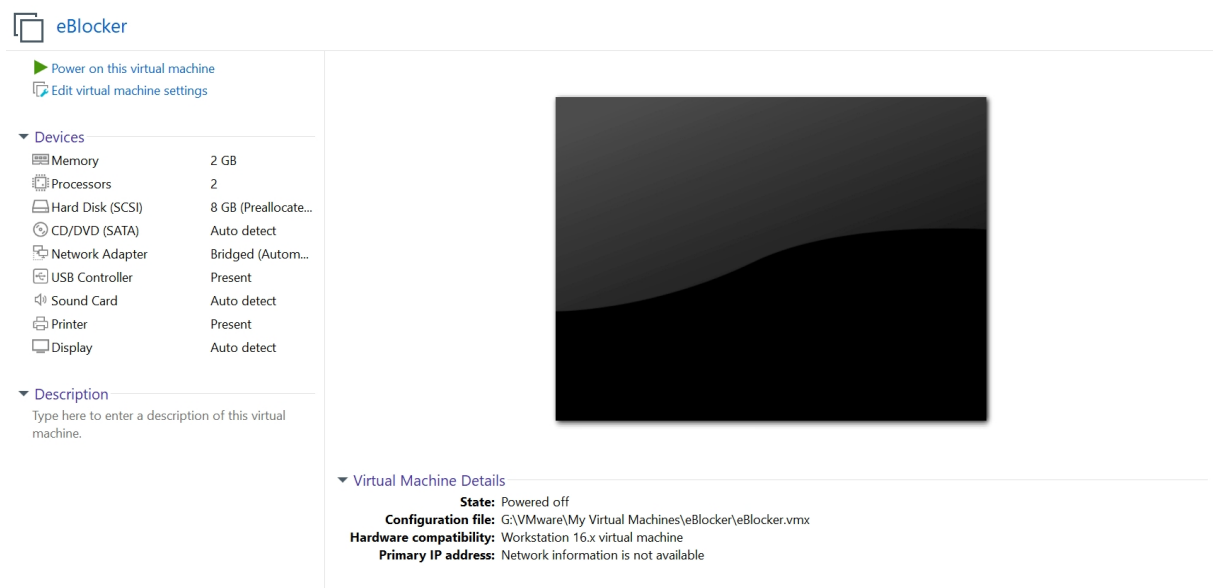

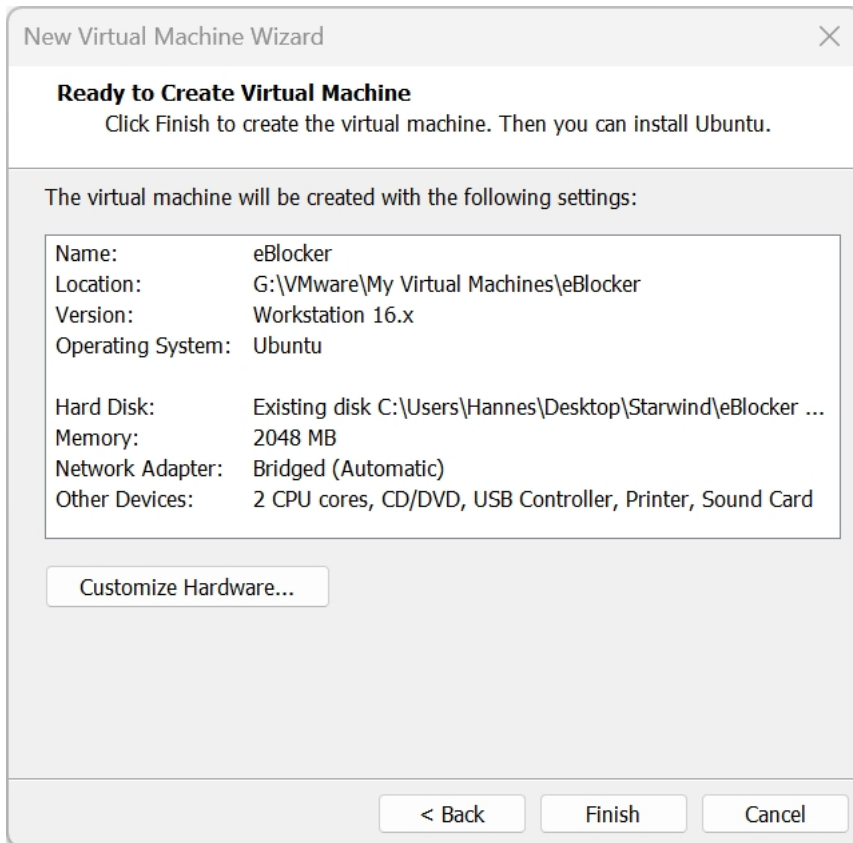

now you have to select the image you created before, NOT the flat.vmdk but the vmdk, continue

If you continue, you will be asked if you wanna keep the existing VM format or change tot he new format, i chosed keep!!!

and select Finish, and at the end this window appears...

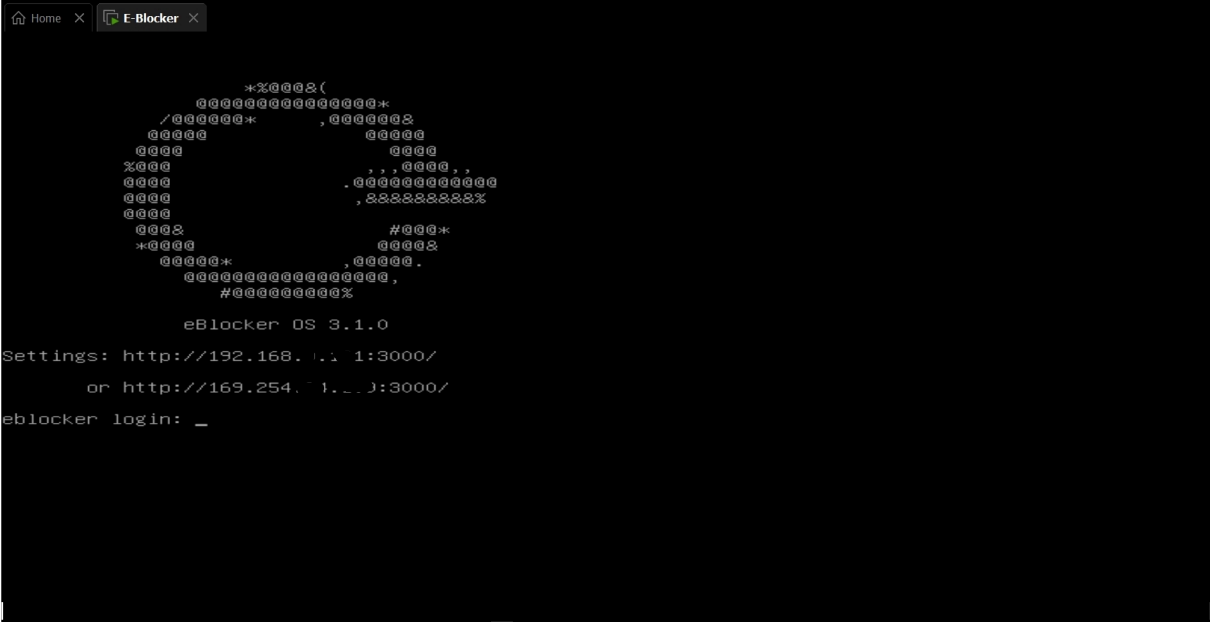

When you then click on Power on, after a few seconds (you may have to confirm 1-2 more messages) this window should appear, of course with an IP that matches your network!

In this window you will be shown how to access the eBlocker user interface via your preferred web browser, in my case

<http://192.168.xx.xx1:3000> (I replaced the numbers replaced with x because I don't know how safe it is to publish the IP here in full, even if it is only an internal address, I have blacked them out in the picture...

You will then definitely get a message saying something like this address is not secure, depending on the web browser this page is not secure, there I then had to confirm with continue to the http page, and add exception or something similar and then you get to the eBlocker welcome page, where you can log in, register and select your preferred language. For all further steps you have to consult the help or other tutorials here in the forum!

This is my first tutorial, so I hope you'll be lenient and understand, along with the pictures, what it's actually about and because German is my mother tongue and this forum is English, I've written it in two languages...

Have fun crafting!!!
